

AI Quality Evaluation Portfolio

QA Summary Report

Batch-02 (EVAL-011 – EVAL-020)

Batch Information

Field	Details
Batch ID	Batch-02
Evaluation Range	EVAL-011 – EVAL-020
Total Evaluations	10
Approved	5
Not Approved	5
Approval Rate	50%
Primary Evaluation Focus	Instruction Following, Factual Accuracy, Practical Guidance, Safety, Relevance, and Completeness

Overall Statistics

Batch-02 consisted of an equal distribution of Approved and Not Approved evaluations, reflecting a deliberate increase in response complexity compared to Batch-01. While most responses consistently followed user instructions and addressed all requested components, half failed to meet the expected quality standard due to factual inaccuracies, unsupported absolute claims, or unsafe guidance. The evaluation results indicate that response completeness remained consistently strong, whereas factual reliability emerged as the primary quality challenge across the batch.

Overall Assessment

Compared to Batch-01, Batch-02 shifted the evaluation focus from identifying incomplete responses to validating the correctness and reliability of the information provided. Although instruction following and response organization remained consistently strong, the increased occurrence of factual inaccuracies demonstrated that complete responses are not necessarily reliable responses. The batch reinforces the importance of balancing completeness with evidence-based accuracy, particularly in educational, technical, and safety-related content where incorrect information may directly influence user decisions.

Strengths

- Strong adherence to multi-part user instructions across diverse domains.
- Consistently organized, well-structured, and easy-to-follow responses.
- Practical and actionable guidance tailored to the user's intent.
- Appropriate tone and readability for educational, informational, and advisory requests.
- High consistency in response completeness and overall organization.

Weaknesses

- Factual Accuracy was the most frequently observed quality issue throughout the batch.
- Multiple responses contained unsupported absolute claims that overstated factual information.
- One response provided unsafe guidance that conflicted with established safety practices.
- Several responses appeared complete and well-written but contained incorrect information within key concepts, reducing their overall reliability.
- Minor instances of repetitive or less personalized content were observed, although these did not consistently impact the overall quality standard.

Recommendations

Priority	Recommendation
High	Strengthen factual verification before presenting information as definitive.
High	Avoid unsupported absolute language such as "always," "never," and "completely" unless supported by established evidence.
High	Ensure all safety-related guidance aligns with accepted best practices and recognized standards.
Low	Preserve strengths in instruction following, response structure, clarity, and practical guidance while improving factual precision.

Executive Summary

Batch-02 evaluated 10 AI-generated responses, resulting in 5 Approved and 5 Not Approved decisions, with an overall approval rate of 50%. The batch introduced more challenging calibration scenarios than Batch-01 by emphasizing factual verification, safety assessment, and evidence-based reasoning over instruction following alone. Factual Accuracy emerged as the dominant issue type, while instruction following remained consistently strong across all evaluations. Overall, Batch-02 demonstrates a clear progression toward more rigorous and objective quality assessment by reinforcing that response completeness must be accompanied by factual correctness and reliable guidance to satisfy expected quality standards.
